

Is Florida getting warmer?

The observed correlation coefficient between years and temperature(degree celsius) of Florida was 0.533. (Figure1).

After random sampling our temperature data by $N=10000$ and recalculating the correlation coefficient, our observed correlation coefficient was not within the distribution of our random correlation coefficients (Figure2). This suggest that there is a statistically significant moderate correlation between times and years; as years increase, temperature of KeyWest Florida rises ($p=0$). As a result, the current trend can suggest that Florida is getting warmer.

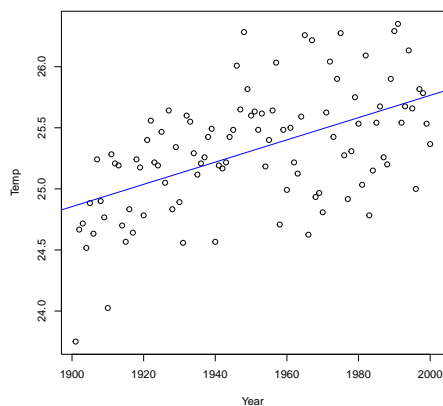

Figure 1: This graph demonstrates the annual temperatures from Key West in Florida, USA for the 20th century

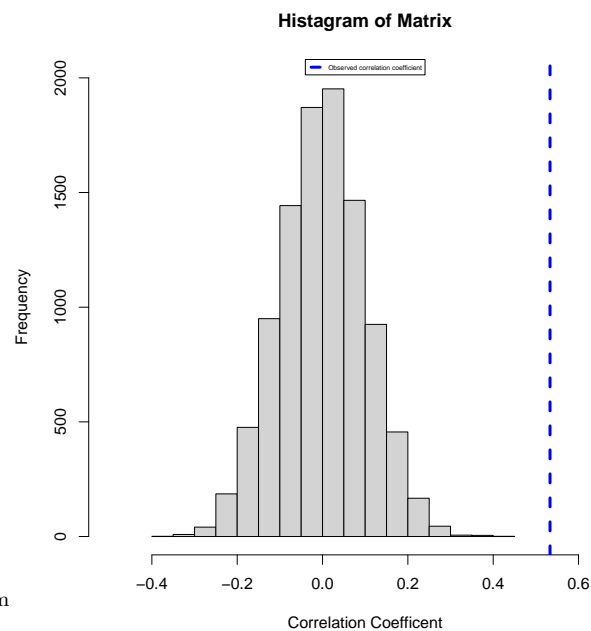

Figure 2: The distribution of random correlation coefficient calculated from reshuffling the temperatures. The observed correlation coefficient is represented by the trendline.
